Part 2: Setup and Prototype (Hello World!)

Link Used to get started: <https://docs.flutter.dev/install/quick>

Step 1: Make sure you have git installed

Step 2: Install Visual Studio Code (VS Code)

Step 3: Install the Flutter extension

Step 4: Open Command Palette (on Mac its cmd + shift + P)

Step 5: Search Flutter and select “Flutter: New Project”, Then select Download SDK

I ran into a problem here where I had to download the SDK. I was able to figure it out — all I had to do was accept the license agreement by running `sudo xcodebuild -license` and accepting the terms.

Step 6: Select Clone Flutter after download SDK (Could take a few minutes)

Step 7: Click Add SDK to Path

Step 8: Create a new flutter app by opening command palette and typing in “Flutter: New Project” -> Select Application Template

Step 9: Select a folder for your new project and name your project

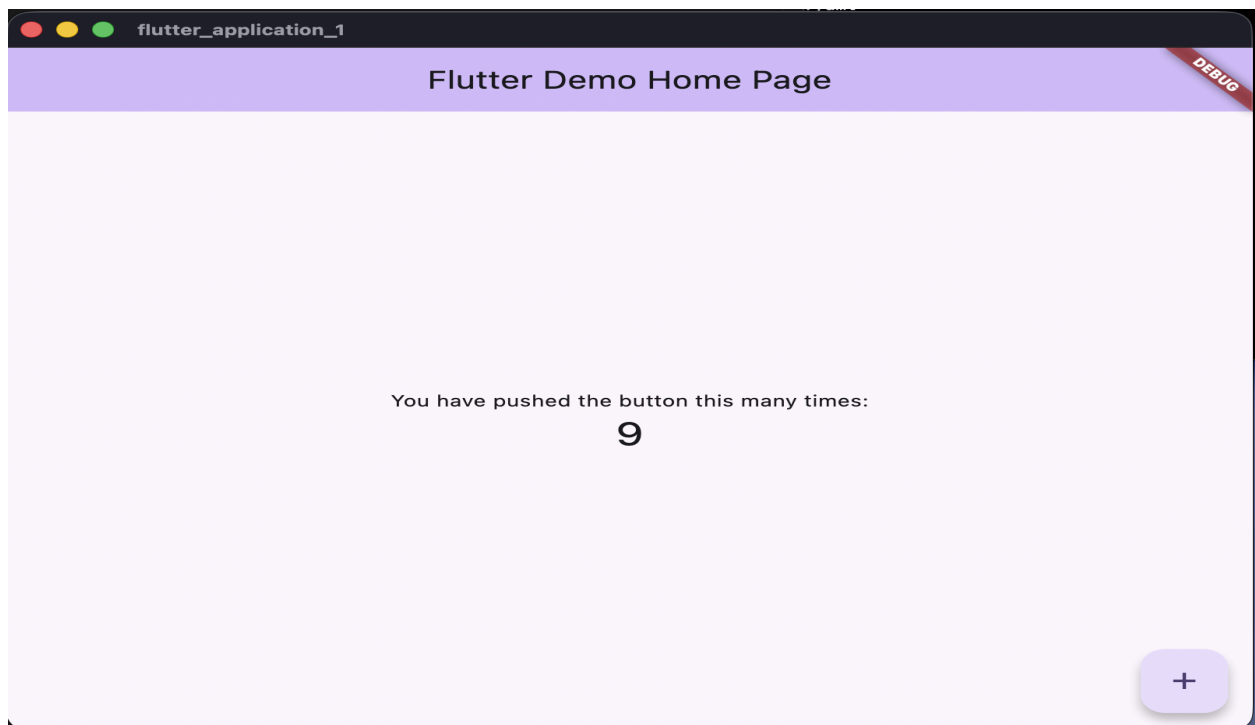

Step 10: Run your program by typing in the terminal “flutter run” (Make sure you are in the correct project directory)

I ran into a problem where I could not run the application. It asked me to choose which device I wanted to run it on, and I first chose macOS, but it wouldn't work and returned a large error. I search up the problem and found out that I needed to clear extended attributes, then clean and rebuild the project by running the following commands:

```
xattr -cr .  
flutter clean  
flutter run -d macos
```

This still did not resolve the issue, so I looked again and found that the problem could be caused by the project being located inside an iCloud synced folder. I checked Finder and confirmed that the project was inside an iCloud sync folder. I then moved the project outside of the iCloud sync folder and ran the same commands again, his time it worked and the app started running successfully. I also tested it on the Chrome (web) version, and it worked there as well.

Step 11: Run program by clicking on the main.dart file inside of lib and clicking Run at the top and then Start Debugging

Alternative Option: Instead of using the Application Template You can choose the empty application template.

It took me an extra hour to figure out how to look at widgets because the flutter icon wasn't at the activity bar on the left. Instead I had to run my program and look at the bottom and click on dev tools and then i open widgets. From 8 to 8:45
